Tattoo removal

Ultra pulse CO2 laser – the latest in effective tattoo removal.

The use of the Ultra Pulse CO2 laser, a micro surgical laser beam – vaporises the ink in the tattoo. The skin is left in tact where no bleeding occurs in the treated area, resulting in a quick healing time with minimal damage to the skin texture. After the 1st session majority of the tattoo is removed – light scabbing forms over the area which then falls off revealing any residual ink (if any), a possible 2nd or 3rd treatment might be required +/- 2 months apart in order to remove any residual ink that is still visible and encourages a better healing response from the skin.

Due to the powerful nature of the laser an anaesthetic can be administered before the commencement of the procedure.

Majority of **other** laser/light procedures require approximately 10 sessions for effective tattoo removal resulting it being expensive and time consuming - the Ultra Pulse CO2 laser at the Laser Clinic – Canal Walk is one of a kind in South Africa and has proven to be the most effective laser in complete tattoo removal.

Prices range from R850 upwards depending on the size and detail of the tattoo. Please call us to book a consultation with the doctor if a quote is required or email a picture of the tattoo with a ruler placed clearly next to it (Breadth and Width) laserclinic.cw@telkomsa.net
